Continuation of Disposition of Claims: Claims pending in the application are 1-3,6,8,9,11-19,21,22,24-26,29-33,36,37,39-41,43-46,49-57,61-65,68 and 71-76.

Continuation of Disposition of Claims: Claims withdrawn from consideration are 1-3,6,21,22,24-26,29-33,36,37,39-41,43-46,49-57,61-65,68 and 71-76.

DETAILED ACTION

Summary

- This is the initial Office Action based on the McCORMACK et al. application filed under the Patent Cooperation Treaty on March 4, 2005, now a National Stage Application, and response to restriction requirement filed with the Office on April 21, 2010.
- 2. Claims 1-3, 6, 8, 9, 11-19, 21, 22, 24-26, 29-33, 36, 37, 39-41, 43-46, 49-57, 61-65, 68, and 71-76 are pending and claims 8, 9, and 11-19 have been fully considered.

Election/Restrictions

3. Applicant's election with traverse of Group II, claims 8, 9, and 11-19 in the reply filed on April 21, 2010, is acknowledged. The traversal is on the ground(s) that the cited lacking feature of Group I, a counter electrode, is recited in claim 36, and that the Applicants believe that at least Group II does not have any technical features lacking from claims associated with Group I.

This is not found persuasive because, while a counter electrode is explicitly recited in claims of Group I, Group I claims and Group II claims do not have the same technical features. On the contrary, Group I, as delimited in claim 1, is drawn to an electrode for use in an electrochemical sensor, which explicitly "excludes an electrode based on carbon having derivatized thereon two redox-

active species " (emphasis added). Group II, as set forth in claim 8, explicitly recites a pH sensor comprising, *inter alia*, a working electrode comprising carbon modified with a chemically sensitive redox active material". These two claims are drawn then to wholly different invention which lack unity as one explicitly excludes a necessary component of the other, namely a carbon-based electrode that has been modified with a redox active material. No comments are made by Applicants in response to the lack of unity with regard to Groups III and IV, and associated claims of these groups have been cancelled in the response by the Applicants.

The requirement is still deemed proper and is therefore made FINAL.

Specification

4. The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

Art Unit: 1795

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

- 6. The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
 - 1. Determining the scope and contents of the prior art.
 - 2. Ascertaining the differences between the prior art and the claims at issue.
 - 3. Resolving the level of ordinary skill in the pertinent art.
 - 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
- 7. Claims 8, 9, and 11-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over WRIGHTON et al. (US 5,223,117).

Regarding claim 8, WRIGHTON discloses a pH sensor (Col. 2, line 9) comprising:

a working electrode (12, Figures 1a & 1b) comprising carbon (Col. 13, line 45 & Col. 14, lines 10-13) modified with a chemical sensitive redox active material (Col. 13, lines 45-46); and

a counter electrode (14, Figures 1a & 1b),

wherein the ratio of the surface area of the working electrode to the surface area of the counter electrode is $1:10^2 - 10^3$ (Col. 3, lines 51-53).

Art Unit: 1795

WRIGHTON does not explicitly teach the surface area of the working electrode to the surface area of the counter electrode is in the range from 1:10 to 10:1.

However, it has been held where the only difference between the prior art and the claims was a recitation of relative dimensions of the claimed device and a device having the claimed relative dimensions would not perform differently than the prior art device, the claimed device was not patentably distinct from the prior art device (*Gardner v. TEC Systems, Inc.*, 725 F.2d 1338, 220 USPQ 777 (Fed. Cir. 1984), *cert. denied*, 469 U.S. 830, 225 USPQ 232 (1984)).

Regarding claim 9, WRIGHTON teaches the surface area of the working electrode is 250 μm^2 (100 μ m long × 2.5 μ m wide; Col. 5, lines 39-40).

Regarding claim 11, WRIGHTON discloses a pH sensor (Col. 2, line 9) comprising:

a working electrode (12, Figures 1a & 1b) comprising carbon (Col. 13, line 45 & Col. 14, lines 10-13) modified with a chemical sensitive redox active material (Col. 13, lines 45-46); and

a counter electrode (14, Figures 1a & 1b),

wherein the surface area of the working electrode is 250 μm^2 (100 μm long × 2.5 μm wide; Col. 5, lines 39-40).

WRIGHTON does not explicitly teach the surface area of the working electrode is in the range from 500 μm^2 to 0.1 m^2 .

However, it has been held where the only difference between the prior art and the claims was a recitation of relative dimensions of the claimed device and a device having the claimed relative dimensions would not perform differently than the prior art device, the claimed device was not patentably distinct from the prior art device (*Gardner v. TEC Systems, Inc.*, 725 F.2d 1338, 220 USPQ 777 (Fed. Cir. 1984), *cert. denied*, 469 U.S. 830, 225 USPQ 232 (1984)).

Regarding claim 12, WRIGHTON teaches the surface area of the working electrode to the surface area of the counter electrode is $1:10^2 - 10^3$ (Col. 3, lines 51-53).

WRIGHTON does not explicitly teach the surface area of the working electrode to the surface area of the counter electrode is in the range from 1:5 to 3:1.

However, it has been held where the only difference between the prior art and the claims was a recitation of relative dimensions of the claimed device and a device having the claimed relative dimensions would not perform differently than the prior art device, the claimed device was not patentably distinct from the prior art device (*Gardner v. TEC Systems, Inc.*, 725 F.2d 1338, 220 USPQ 777 (Fed. Cir. 1984), *cert. denied*, 469 U.S. 830, 225 USPQ 232 (1984)).

Regarding claim 13, WRIGHTON teaches the surface area of the working electrode is 250 μm^2 (100 μ m long × 2.5 μ m wide; Col. 5, lines 39-40).

WRIGHTON does not explicitly teach the surface area of the working electrode is in the range from 0.5 mm² to 10 mm².

However, it has been held where the only difference between the prior art and the claims was a recitation of relative dimensions of the claimed device and a device having the claimed relative dimensions would not perform differently than the prior art device, the claimed device was not patentably distinct from the prior art device (*Gardner v. TEC Systems, Inc.*, 725 F.2d 1338, 220 USPQ 777 (Fed. Cir. 1984), *cert. denied*, 469 U.S. 830, 225 USPQ 232 (1984)).

Regarding claim 14, WRIGHTON teaches the chemically sensitive redox active material is sensitive to a change in pH (Col. 4, lines 30-35).

Regarding claim 15, WRIGHTON teaches the carbon is modified by derivatisation via physical adsorption of the chemically sensitive redox active material (Col. 4, lines 57-60).

Regarding claim 16, WRIGHTON teaches the working electrode further comprises at least a chemically insensitive redox active material (Col. 4, lines 23-25).

Regarding claim 17, WRIGHTON teaches "one or more redox reagents" that are chemically sensitive to the analyte (Col. 4, lines 30-32), which implies that chemically sensitive redox active material may comprises more than one different compound (e.g., Col. 4, lines 33-35).

Regarding claim 18, WRIGHTON teaches "one or more redox reagents" that are chemically sensitive to the analyte (Col. 4, lines 30-32), which implies that chemically sensitive redox active material may comprises more than one different compound (e.g., Col. 4, lines 33-35). WRIGHTON additionally teaches the working electrode comprises a redox material that is insensitive to change in pH (i.e., the analyte; Col. 4, lines 23-25). WRIGHTON states "[w]hat qualifies as a suitable reference redox reagent can vary from application to application or medium to medium" (Col. 4, lines 27-29).

WRIGHTON does not explicitly teach the working electrode comprising two insensitive redox active materials.

At the time of the present invention, it would have been obvious to one of ordinary skill in the art, given the suggestion that the suitable reference redox reagent (i.e., the insensitive redox active material of the working electrode) may vary per the application and medium to try utilizing two insensitive redox active materials in an effort to optimize the response of the described invention of WRIGHTON.

8. Claim 19 is rejected under 35 U.S.C. 103(a) as being unpatentable over WRIGHTON et al. (US 5,223,117) as applied to claims 8, 9, and 11-18 above, and further in view of an article by PANDURANGAPPA et al. ("Homogeneous chemical derivatisation of carbon particles: a novel method for functionalizing carbon surfaces", THE ANALYST, vol. 127, no. 12, Dec. 2002, p. 1568-1571), submitted to the Office on an Informational Disclosure Statement.

WRIGHTON teaches the limitations of claims 8 and 14, as outlined above.

WRIGHTON teaches explicitly as chemically sensitive redox active materials compounds that undergo reversible chemical reaction when subjected to cyclic voltammetry (Col. 4, lines 33-35), but does not make mention of a chemically sensitive redox active material that undergoes irreversible chemical reaction when subjected to cyclic voltammetry.

However, PANDURANGAPPA discloses use of an electrode with a chemically sensitive redox active material that is 4-nitrobenzenediazonium ("3.2 Chemical reduction of 4-nitrobenzenediazonium tetrafluoroborate in the presence of carbon powder" section, p. 1569), which has a proton dependent electrochemistry (Scheme 2b) and would therefore be pH sensitive. As a nitro group-containing compound, it undergoes irreversible chemical reaction when subjected to cyclic voltammetry.

At the time of the present invention, it would have been obvious to one of ordinary skill in the art that substitution of a known element, the chemically

Art Unit: 1795

sensitive redox active materials taught by WRIGHTON, with another known element, 4-nitrobenzenediazonium as taught by PANDURANGAPPA, would have yielded predictable results (KSR International Co. v. Teleflex Inc., 550 U.S.__, 82 USPQ2d 1385 (2007)).

Conclusion

9. Any inquiry concerning this communication or earlier communications from the examiner should be directed to J. CHRISTOPHER BALL whose telephone number is (571)270-5119. The examiner can normally be reached on Monday through Thursday, 9 am to 5 pm Eastern.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nam Nguyen can be reached on (571) 272-1342. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
